Biographical Notes

Henry Milner is an associate in the Department of Political Science, Université de Montréal, a fellow at the Institute for Research in Public Policy and a visiting professor at Umeå University in Sweden. He has written and edited numerous articles and books, including *Civic Literacy: How Informed Citizens Make Democracy Work* (2002). He is co-publisher of *Inroads*, the Canadian journal of opinion and policy. In 2004-05 he held the Chair in Canadian Studies at the Sorbonne, and in 2005-06, he was Canada-US Fulbright Chair at State University of New York (Plattsburgh).

Peter John Loewen is a doctoral student in the Department of Political Science, Université de Montréal, and a research associate with the Canada Research Chair in Electoral Studies. His doctoral research focuses on the application of experimentation in political science. Substantively, his research addresses topics related to electoral politics, electoral institutions and public opinion in Canada. Recent work appears in the *Canadian Journal of Political Science* and in *Democratic Reform in New Brunswick* (2007) and *Voters' Veto: The 2002 Election in New Zealand and the Consolidation of Minority Government* (2004).

Bruce M. Hicks is a research associate with the Canada Research Chair in Electoral Studies at the Université de Montréal. A former political strategist, journalist and publisher, he has been a reporter for print and for radio (NPR), Ottawa bureau chief for United Press International (UPI) and a syndicated columnist for, mostly, Thomson newspapers. He has edited such resource books as *The Parliamentary Rolodex* and the *Directory of Government* (Financial Post). Recent work appears in *Constitutional Forum*, *Review of Constitutional Studies* and *Parliamentary Perspectives*, as well as IRPP's *Policy Options* and *Policy Matters*. His current research interests are Senate reform, the Constitution and political participation and representation.

Summary

Voter turnout has been in decline in Canada since the late 1980s. In the decades following the Second World War, there was an average turnout for federal elections of approximately 75 percent; during the past two decades, however, the average percentage has dropped to the low 60s. Similar drops are being witnessed in most other established democracies. There is also mounting evidence that this phenomenon is having a variable impact on our society — the largest voter turnout decline is among young people.

While any drop in turnout is cause for concern, the fact that young people are among the most disenfranchised in society is especially troubling. Voting appears to be a socialized behaviour learned early in life. Therefore, if the young fail to vote when they reach the age of majority, it is possible that they will remain forever disengaged from the political system. It is even possible that the current low participation rate will extend to future generations.

Not surprisingly, the decline in turnout has been of growing concern to political scientists and politicians during the past 20 years. When turnout dropped below 62 percent in the 2000 federal election, many — including the Chief Electoral Officer of Canada — were forced to acknowledge that if the trend continued, then Canada may need to consider compulsory voting. The practice has been instituted in more than 20 democracies around the world. A sanction (usually minimal) is imposed on any citizen who fails to go to a polling station on election day and cast a vote. The impact of compulsory voting is significant. Countries where it is practised have an average turnout rate that is 15 percentage points higher at the federal/national level; the turnout rate at the provincial/regional or local level is even higher.

The effectiveness of compulsory voting is without question. Advocates have also claimed that compulsory voting will lead to a more engaged and informed electorate, but this has yet to be empirically verified. In this study, Henry Milner, Peter John Loewen and Bruce Hicks tested this claim by engaging in a unique experiment involving college students who were eligible to vote for the first time, in the 2007 Quebec election. They asked two groups of students to complete two surveys (the first before the election and the second after the election), for which they would be paid. One group, however, was told they would only receive their remuneration if they voted. By comparing the results, the authors could ascertain whether a financial disincentive to abstain motivated young citizens to inform themselves about the election.

This study contributes to the debate over this important and complex question. Generally, it explores some of the issues surrounding mandatory vot-

ing. More specifically, using the Quebec provincial election of 2007, the authors have designed and implemented a field experiment aimed directly at young people (the group of voters likely to be most positively affected in terms of turnout if voting were compulsory) in order to determine the implications of compulsory voting on political knowledge and engagement. The experiment has shown that when a young person is made to vote in an election, his or her attentiveness to politics or knowledge about politics does not necessarily increase. Does this mean that compulsory voting would not have a beneficial impact on young people over the long term? Do arguments in favour of compulsory voting outweigh the counter-argument that compulsory voting would merely increase the number of ill-informed voters? Would political parties change their behaviour if faced with a larger number of voters?

Canadians need to discuss such questions, and this paper attempts to set out, in a dispassionate manner, many of the issues that will facilitate the discussion. It also contributes research on one particular aspect of the debate: the direct, short-term impact of compulsory voting on young nonvoters' political knowledge. In short, this paper is a salvo in the debate over compulsory voting — a debate that is likely to continue as long as voter turnout for Canadian federal, provincial and municipal elections remains low.

Résumé

La participation électorale décroît au Canada depuis la fin des années 1980. Alors qu'au cours des décennies qui ont suivi la Deuxième Guerre mondiale, le taux de participation aux élections fédérales atteignait en moyenne 75 %, ce pourcentage a chuté depuis une vingtaine d'années, et il se situe maintenant à un peu plus de 60 %. On observe des baisses semblables dans la plupart des pays de tradition démocratique. Cependant, c'est parmi les jeunes que l'on observe la baisse de participation électorale la plus importante.

Toute diminution de la participation électorale est source de préoccupation, mais que les jeunes constituent le groupe de citoyens qui se prévalent le moins de leur droit de vote est un fait particulièrement troublant. Voter semble être un comportement social que l'on apprend jeune. Par conséquent, si les jeunes ne vont pas voter quand ils atteignent la majorité, on peut penser que, pendant le reste de leur vie, ils ne participeront pas davantage à la vie politique. Et il est possible que le faible taux de participation actuel s'étende ainsi aux générations futures.

On comprend donc facilement que, depuis 20 ans, la chute de la participation électorale constitue un sujet de préoccupation croissant chez les politologues. Quand, au scrutin fédéral de 2000, le taux de participation est passé sous les 62 %, plusieurs — dont le directeur général des élections du Canada — ont été forcés d'admettre que, si la tendance se maintient, le Canada devra sérieusement considérer l'instauration du vote obligatoire. Cette mesure existe déjà dans plus de 20 pays démocratiques ; une peine (habituellement minime) est imposée à tout citoyen qui néglige d'aller voter le jour d'une élection. L'impact est significatif : dans les pays où le vote est obligatoire, le taux moyen de participation aux élections nationales ou fédérales est supérieur de 15 % au taux observé avant l'instauration du vote obligatoire ; aux élections régionales, provinciales ou municipales, les chiffres sont encore plus élevés.

Le vote obligatoire est donc une mesure efficace. Ceux qui le préconisent soutiennent de plus (mais sans l'avoir démontré empiriquement) que, quand le vote est obligatoire, les citoyens s'informent davantage et participent de plus près à la vie politique. Dans cette étude, Henry Milner, Peter John Loewen et Bruce M. Hicks ont donc cherché à vérifier cette hypothèse en menant une recherche originale auprès de deux groupes d'étudiants de niveau collégial pendant la campagne électorale québécoise de 2007. Ils ont payé ces deux groupes pour qu'ils participent à deux sondages ; un sondage leur a été donné au début de la campagne électorale et l'autre à la fin. Un des deux groupes devait, cependant, aller voter pour obtenir sa rémunération. En comparant les résultats des deux groupes, les chercheurs ont pu établir dans quelle mesure un élément financier

incitant des jeunes à aller voter a pu, en même temps, les motiver à mieux se renseigner sur les enjeux de la campagne électorale.

Cette étude apporte donc de nouveaux éléments à un débat sur un sujet important et complexe. Tout d'abord, on y aborde certaines questions générales liées au vote obligatoire. Ensuite, de façon plus particulière, les auteurs présentent la recherche sur le terrain qu'ils ont conçue et menée durant la campagne électorale québécoise de 2007, et qui ciblait directement les jeunes (le groupe de citoyens susceptibles d'être les plus touchés par le vote obligatoire, puisque ce sont ceux qui votent le moins). Ils ont ainsi tenté de vérifier si le vote obligatoire a ou non un effet sur l'intérêt que les jeunes portent à la chose politique. Les résultats démontrent que ceux qui participent à un scrutin ne s'intéressent pas nécessairement plus à la politique que ceux qui ne votent pas ; ils ne cherchent donc pas non plus à s'informer davantage. Toutefois, on peut se demander si, à long terme, le vote obligatoire aurait ou non un effet positif sur les jeunes. Est-ce que les avantages potentiels du vote obligatoire pourraient éclipser ses effets négatifs possibles (c'est-à-dire ne faire qu'augmenter le nombre de votants mal informés) ? Est-ce que les partis politiques modifieraient leur attitude s'ils devaient convaincre un plus grand nombre d'électeurs ?

Il est essentiel que les Canadiens entreprennent ce débat ; c'est pourquoi cette étude tente de formuler, de façon objective, plusieurs des questions qu'ils auraient lieu de se poser. De plus, l'étude éclaire le débat sur un aspect précis, c'est-à-dire l'absence d'un effet direct et immédiat du vote obligatoire sur l'intérêt que les jeunes qui ne votent pas portent à la chose politique. Bref, grâce à cet article, les auteurs espèrent enrichir un débat qui se poursuivra à coup sûr, tant que la participation électorale (à tous les niveaux de gouvernement) n'augmentera pas de façon significative.

Does compulsory voting lead to a more engaged and knowledgeable electorate? That it results in higher levels of political participation is without question. However, the second-order effects of compulsory voting, especially its effects on political engagement and knowledge, are not well established. This paper provides an analysis of the results of a field experiment carried out during the Quebec provincial election campaign of March 2007. The purpose of the experiment was to determine whether compulsory voting and voting incentives lead to more attentive and knowledgeable voters. Advocates of compulsory voting generally claim that it will lead to a more engaged citizenry; in particular, they claim that the currently disengaged will inform themselves as a natural by-product of having to vote.¹

In examining this aspect of compulsory voting, we do not cast judgment on its overall merits. There are other arguments in favour of compulsory voting, such as those related to political equality in a democracy and to the fact that increased turnout may compel political parties to reach out with their policies to disengaged communities. However, voter knowledge is a dimension of compulsory voting that proponents incorporate to varying degrees in their argumentation, and it has yet to be put to an experimental test.

In this paper, we provide experimental evidence that casts some doubt on the claim that the act of voting, as forced by sanction or encouraged by incentive, will cause voters to become information seekers. Following this introduction, the paper is separated into two parts: in the first, we present arguments for and against compulsory voting and incentives, touching on experiences in other countries, we look at the debate in Canada and we present a review of the empirical literature on the effects of compulsory voting; in the second part, we describe the methodology and the results of our experiment. We conclude with a discussion of our findings and an assessment of their wider implications.

It is well known that voter turnout has been declining in most advanced democratic countries — Canada certainly included. From the Second World War until 1988, this country had a consistent participation level among registered voters in federal elections; it averaged about 75 percent. But in the past two decades, that percentage has dropped steadily, reaching the low 60s. Various studies have shown that in Canada and elsewhere, this trend is largely attributable to the voting — or, rather, nonvoting — habits of the new cohorts of voters who reached voting age during this period (Milner 2005; Blais et al. 2002; O'Neil 2001).

In most countries, second-tier (provincial) and third-tier (municipal) elections usually have lower voter turnout than first-tier (presidential or parliamentary) elections. In Canada, turnout for second-tier and third-tier votes has historically lagged behind turnout for elections at the federal level by between

15 and 40 percentage points, but the gap has decreased as federal electoral participation has fallen (though with noticeable variations by province, city and town, and by election).

We should note, since the experiment used for this study was carried out in Montreal during a provincial election, that the Province of Quebec has in the last four decades consistently been an exception, with turnout rivalling — and sometimes exceeding — that for federal elections in Canada. However, in recent Quebec elections, turnout levels have also begun to decline; the 2003 provincial election engaged only 70 percent of registered voters.

Very little research has been done using cohort analysis at the provincial level but, based on evidence from federal elections, it is reasonable to assume that there is a strong cohort differential here, too, with young people failing to participate at the levels of previous generations. Decline in youth voting is additionally troubling because voting patterns in early elections can carry forward into future elections. The initial voting experience affects whether or not a citizen will be politically engaged or disengaged — those who fail to vote early in life may remain nonvoters as they age (Franklin 2004; Green and Shachar 2000; Gerber, Green and Shachar 2003).² Hence, if the decline in turnout around the world is disproportionately attributable to young people, and if the socializing effects of voting are weaker among the youth of today than among previous generations, then the issue of compulsory voting and voting incentives is of particular relevance to them.

There is also evidence that low socio-economic status is linked to low voter turnout (Hicks 2006; Blais 2000; Bakvis 1991). Uneven turnout based on race, ethnicity and class is worrisome in that it could lead to certain segments of society exerting greater influence on elections and thus on government programs and policies. As Linder has noted with respect to Switzerland, “especially when participation is low, the choir of Swiss direct democracy sings in upper- or middle-class tones” (1994, 95). While not all agree that election outcomes would differ greatly if there were full turnout (Rubenson et al. 2007; Martinez and Gill 2006; Citrin, Schickler and Sides 2003), the possibility alone is cause for concern.

The fundamental objective of compulsory voting is to increase voter turnout (Watson and Tami 2001). That this happens is clearly supported by the Australian and European experiences. In addition, compulsory voting is credited with decreasing disparities in participation due to age and socio-economic background. This is particularly true when fines for not voting are levied and when voting is made compulsory in second-tier and third-tier elections. Yet in all the discussion about compulsory voting in the literature, and despite proponents’

claims that compulsory voting will lead to a more knowledgeable electorate, the one thing that is not examined empirically is how such initiatives might affect the political attentiveness of citizens. In short, we do not know if people who cast a ballot under threat of financial penalty are any more likely to educate themselves about the issues and candidates.

In the context of a generation-linked turnout decline, it is appropriate to focus on young people who have just arrived at voting age. Since the young vote in such low numbers, the impact of compulsory voting should be greatest on them. This was suggested by Print, who found that among young Australians (aged 16 to 18) the percentage responding in the affirmative when asked if they planned to vote declined from 86 to 50 when the question was rephrased to determine whether they would still do so if voting were not compulsory (2006).

Our study involved young people living in the Montreal region, and the election was a Quebec provincial one; we found our participants at a college chosen for its large number of students from a diversity of ethnic groups and socio-economic backgrounds. But there is nothing inherent in this experiment that required it to be carried out where and when it was. Indeed, it could have been conducted around an election at a different political level or in another democratic society. We chose to focus on this particular election because during the election period, the necessary resources and cooperation were available to us: we were physically present in Montreal, and we had access to a group of young people at the cusp of the legal voting age. There is nothing about the milieu from which the participants were selected that precludes the findings of this study from being generalized to youth in other jurisdictions and, perhaps, to all voters.

The circumstances surrounding the March 2007 Quebec election were very promising, as far as participation was concerned. Not only had several measures to facilitate ballot access been instituted for 2007 by the Directeur général des élections (DGE) — extending the period for advance polls, removing any obligation to justify using them, installing voting booths in seniors residences and allowing those with impaired mobility to vote at home³ — but also the race was unusually competitive. Indeed, many observers characterized it in the lead-up as the most interesting in a century, with three political parties competing to form the government all the way to the end; and this should have stimulated turnout (Franklin 2004; see also Blais 2006). Yet turnout improved only marginally: up 0.79 percentage points from 2003. Clearly, many people, including young ones, did not vote. It is thus timely to look more closely at reforms that could boost turnout, such as compulsory voting and voting incentives.

The Debate Surrounding Compulsory Voting

The decline in voter turnout in democratic countries in recent decades has renewed interest in compulsory voting and voter incentives (Wattenberg 2007). But such measures have been employed since the birth of democracy — the first time was in the direct democracy of ancient Athens. In that city-state, the People's Assembly was convened on a hill called the Pnyx. To force people to attend, officials corralled them from the agora (marketplace) below using a rope soaked in red dye (Hicks 2002); the clothing of tardy or unwilling participants was marked by a red stain; there may also have been a fine for nonparticipation (Hansen 1999, 5). Thus were born two of the incentives used today in compulsory voting: public stigmatization and financial penalty.

The vast majority of Athenians were wage earners, and many had to travel great distances to attend the assembly, so in 403 BC, when democracy was reintroduced, assembly pay was given to the poor to cover the costs of attendance (Mavrogordatos 2003, 7). Eventually, assembly pay became the largest expenditure item in the Athenian budget (Hicks 2002). In 380 BC, Plato, who had no love for democracy, ridiculed the practice: "I hear [Pericles] was the first who gave the people pay, and made them idle and cowardly, and encouraged them in the love of talk and money." This was the genesis of the debate over compulsory voting and voter incentives — specifically, the cost to the state versus the actual benefit to both the state and the individual.⁴

In the modern era, compulsory voting began to emerge in representative democracies with the extension of the voting franchise. It was first introduced at the national level in Belgium in 1892, in Argentina in 1914 and in Australia in 1924. Some countries that adopted compulsory voting later reexamined and abandoned it (for example, the Netherlands in 1971 and Italy in 1994); a good number have maintained the practice.

Comparative experience

Table 1 reproduces Gratschew's charting for the International Institute for Democracy and Electoral Assistance (IDEA) of the basic information about the democratic countries that, as of 2001, had some form of compulsory voting (2001). As we can see, there were dramatic differences in the sanctions imposed and the degree of enforcement.

The most effective tool for boosting voter turnout is, of course, the fine. As Gratschew found, 20 countries use fines, and the amounts vary by country, though most are nominal. For example, Switzerland fines nonvoters 3 francs; Argentina, 10 to 20 pesos; and Peru, 20 soles (all of which are equivalent to less

Table 1
The Practice of Compulsory Voting in Other Countries

Country	Type of sanction	Level of enforcement	Year introduced	Comments
Argentina	Explanation, fine, infringement of civil rights or disenfranchisement	Weak enforcement	1912	
Australia	Explanation, fine	Strict enforcement	1924	
Austria (Tyrol)	Explanation, fine	Weak enforcement	n/a	The region of Tyrol

than 7 Canadian dollars). Australia imposes fines of about 20 Australian dollars (17 Canadian dollars). In 13 countries, nonvoters are simply required to provide an explanation, and, if that explanation is deemed legitimate, then no further sanction is enforced (if any exist).

A variety of sanctions have been employed as alternatives to fines. For example, in Belgium, a person who has not voted in at least four elections during the previous 15 years can be disenfranchised. In Peru, voters must carry stamped voting cards for several months after an election as proof of having voted; the cards have to be shown at some public offices before services will be rendered. In Singapore, nonvoters are simply removed from the voter register until they apply to be reinstated. And in Bolivia, voters must produce their voting cards for three months after an election or be denied payment of their salary through a bank. Some communities in Italy have simply posted the names of nonvoters on the town hall door in order to embarrass them; and, in some cases, nonvoters are refused services such as daycare. Mexico similarly relies on arbitrary social sanctions. In Belgium, nonvoters may have difficulty getting a job in the public service, and in Greece, they may encounter difficulties obtaining a new passport or driver's licence. Worldwide, six countries use formal infringements of rights or disenfranchisement to encourage turnout, and four rely on moral suasion and peer pressure. Only four countries use imprisonment. While there does not appear to be any documented case of a person being imprisoned for not voting, there is some lack of clarity on this issue — in Australia, for example, the only sanction is a fine, but if the nonvoter does not pay that fine after several reminders, he or she faces the possibility of incarceration.⁵

Equally significant is the level of enforcement. Only nine countries have strict enforcement; twice as many have weak enforcement or no enforcement at all. And there are eight countries that have compulsory voting legislation that contains no sanctions whatsoever. We should note that what we mean by "compulsory voting" in this context is required attendance at the polling station. The state cannot force a person to vote without drawing back the veil of secrecy that is essential for fair balloting in a democracy. Voters are at liberty to spoil their ballots, and in some countries that have compulsory voting, voters are able to register their abstention on their ballots.

There is also an alternative to imposing restrictions on citizens through legislative compulsion — namely, to offer an incentive. This measure was also used in ancient Athens. While it is not employed widely in the modern era, it is increasingly discussed as an alternative to compulsory voting, since it avoids the politically and emotionally charged issue of making democratic participation compulsory. A voters' lottery has been used in municipal elections in the town of

Evenes, Norway, and it appears to have increased voter turnout (Ellis et al. 2006, 58). Korea is considering using lottery tickets or gift vouchers to stem its turnout decline ("Voting Incentives" 2006). Closer to Canada, a referendum was held in Arizona to decide whether the state would offer each voter the chance to win a million dollars; the proposal made it onto the ballot in November 2006 but was rejected by a margin of two to one (Arizona Secretary of State 2006, 15).

Such incentives are intended to boost voter participation, yet nothing matches compulsory voting in this regard. Approximately 18 percent of European countries use some form of compulsory voting, and all are among the 45 percent of European countries with the highest voter turnout; four of the countries in that 18 percent group are on the list of the top five voter-turnout countries (Keaney and Rogers 2006, 27). When Australia introduced mandatory voting in 1922, its turnout was 57.9 percent; this figure rose to 91.3 percent in the next election in 1925. Voter turnout in that country has averaged about 95 percent since the Second World War (Butt et al. 2006). Similarly, turnout in Belgium has averaged about 93 percent since 1946 (Bennett 2005). In the Netherlands, the average difference in voter turnout before and after the change was 10 percent. This is similar to the difference in presidential election turnout between those Austrian provinces that maintained compulsory voting and those that removed it during the 1980s (Hirczy 1994). When Costa Rica and Uruguay introduced penalties for not voting, their turnouts increased by 15 and 17 percentage points, respectively; and when the Netherlands and Venezuela removed such penalties, they experienced turnout declines of 20 and 30 percentage points, respectively (Watson and Tami 2000, 7). Though estimates of the increase in turnout due to compulsory voting measures vary, every study of Western democracies reports that increase as being between 10 and 15 percentage points for national elections (Jackman 1987; Blais and Carty 1990; Blais and Dobrzynska 1998; Franklin 1996, 2004; Blais and Aarts 2006). And Jackman goes so far as to argue that compulsory voting is the only institutional mechanism that can achieve voter turnout levels of over 90 percent (1987).

Even without sanctions, first-tier elections usually have higher voter turnout than second- and third-tier elections, so turnout increases more dramatically when compulsory voting is applied to subnational elections. In the case of Australia, combining the turnout increase in the various state elections with that in the federal election reveals an average increase of between 12.4 and 37.8 percentage points before and after the introduction of compulsory voting (McAllister and Mackerras 1998, 2). Lijphart points out that "The power of mandatory voting is highlighted by the fact that when it is applied to local elections — as it is in all nations with compulsory voting except Australia — turnout levels are almost the

same as those for presidential and parliamentary elections" (1996, B4). In sum, that "compulsory voting increases turnout [is] a well-established proposition" (Blais 2006, 114).

However, overall turnout is not the only issue related to voter participation. To many, an even more important question is whether there is a turnout differential between various societal groups. If there is, it could result in some segments of society exerting greater influence than others — a phenomenon that would have a number of sociological, economic and even psychological ramifications. As we have noted, the decline in youth participation is now seen as the primary cause of declining voter turnout in many countries; this trend may be increasing within cohorts of young people and could continue as they age (Keaney and Rogers 2006; Milner 2005; Franklin 2004). Additionally, lower turnout may be affecting people disproportionately based on race, ethnicity, education, income and a number of other socio-economic factors. Compulsory voting has the benefit of raising participation rates across categories of citizens. For example, Lijphart, by placing Netherlands voters in a hierarchy of five levels of education attained, found that turnout fell in all groups from above 90 percent to between 66 and 87 percent following the abolition of compulsory voting in 1970; the group with the highest turnout was the one with the highest level of education (1997). A simulation of what would happen in Belgium suggests that there would also be a great disparity in voter attrition; turnout declines among those with low levels of education or professional status would be the most dramatic if compulsory voting were abolished (Hooghe and Pelleriaux 1998).

The Canadian debate

The idea of compulsory voting is not new to Canada. It was first raised in the House of Commons in 1920. Andrew McMaster, a Liberal MP, claimed it would "eliminate a large number of the ways in which money is, or has been, illegally spent at elections."⁶ This gave an unusual twist to the voter-turnout argument by suggesting that if turnout were higher, then it would no longer be possible to buy votes (Hicks 2002).⁷ The usual motivation for the introduction of compulsory voting is the desire to increase turnout, and just four years after this Canadian House of Commons debate, Australia — in response to the 57.95 percent voter turnout in the 1922 election — adopted such a system.

The idea of compulsory voting surfaced during hearings of the Royal Commission on Electoral Reform and Party Financing (the Lortie Commission), as did the idea of voting incentives, though the commission made scant mention of either of these ideas in its report to the government on its public hearings (1991, 4:19). This is perhaps not surprising, given that discussion of compulsory

voting was advanced purely in the context of voter turnout, at a time when Canada was still experiencing relatively high turnout levels. While Jerome Black's research for the commission suggested that voter turnout in Canada was not as high or as stable as was widely believed, neither he nor Munroe Eagles nor Jon H. Pammett (the three political scientists asked to examine voter turnout for the commission) proposed compulsory voting. This led the commission's director of research, Herman Bakvis, to conclude that compulsory voting was probably not in keeping with "Canadian mores and sensibilities" (Bakvis 1991, xx).

The commission itself did pass judgment on the merits of the idea. It concluded that it would be "unacceptable to most Canadians, given our understanding of a free and democratic society" (1991, 1:57), even though the idea of compulsory voting was never proposed to Canadians as part of the commission's formal survey of public opinion (Blais and Gidengil 1991). Among the criticisms the commission levelled at the idea were that in other countries it had not increased turnout to 100 percent, and that the laws are rarely enforced "because citizens must be given the benefit of the doubt when they explain why they did not vote" (1991, 1:56).

Also relevant to the debate on compulsory voting was the commission's consideration of whether, and which, citizens could cast a rational and informed vote — it identified this as one of the "four criteria for determining who should vote,"⁸ albeit "one that has always been more implicit than explicit in our electoral law" (1991, 1:35, 33). This principle of rationality and knowledgeability requires that citizens be able to exercise independent judgment and have the capacity to engage in political discourse; when combined with the criteria of responsible citizenship, it also requires that the state discourage "anything that would bring the vote into disrepute, or devalue it in citizens' eyes" (1991, 1:34). It is upon these principles that the commission hung its recommendation that any person for whom a legal guardian has been appointed or who has been confined by reason of insanity, and anyone under 18 years of age, be denied the vote (1991, 1:41, 49).

The idea of compulsory voting arose again following the 2000 federal election, when turnout dropped to a level approximating Australia's in 1922. Chief Electoral Officer Jean-Pierre Kingsley was asked about the possibility of Canada adopting a compulsory voting regime like Australia's. His immediate response reflected the view of Canada's political elite: he found the idea "repugnant." But he added that "if we start dipping below 60 per cent, I'm going to have to change my mind." The reaction of members of Parliament to the idea was almost universally negative. Public comments ranged from "it won't fly in Canada" (Liberal MP Paul Steckle), to "it may work in Australia, but it won't work here"

(New Democratic Party MP Peter Stoffer), to "I think people do make a conscious choice to not go out and vote, and my feeling is they are entitled to make that choice" (Canadian Alliance MP Ted White).⁹ The views of these politicians also reflected public opinion: when asked, 73 percent of Canadians said they were opposed to compulsory voting (Howe and Northrup 2000, 28).

Most recently, Senator Mac Harb introduced a private member's bill to make voting mandatory.¹⁰ His stated motive in introducing the legislation was that it constituted a "direct response to a rising electoral crisis" (2005, 4) — that is, voter turnout in recent Canadian elections had declined dramatically and was now approaching the 60 percent mark. As table 2 illustrates, turnout in Canada had been relatively stable, in spite of population growth, since the Second World War. The variations among elections could be explained by a number of factors, such as election timing, administrative rules (governing, for example, whether voters were allowed time off work to go to the polls, which day was selected for the vote, how many advance and regular polling stations were set up, and how thorough the enumeration was) and election saliency.

It is well established in other countries that different segments of society participate in elections at different levels based on the resources they possess (education, wealth) and the barriers they encounter (language, relevance of candidates and parties, prejudice). And while there are various interpretations of the degree to which socio-economic status affects turnout in Canada, it is widely acknowledged that "the proportion of low-income families in a riding is consistently a factor associated with lower levels of voter turnout" (Eagles 1996, 315).

Until recently, given the relative stability of voter turnout, electoral law review bodies such as the Lortie Commission and parliamentary committees have been singularly focused on improving administrative procedures, increasing voter awareness, strengthening political parties and ensuring public confidence in the integrity of the process. However, the decline in turnout for Canadian federal elections during the last two decades has given rise to additional concerns. The fact that this decline is concentrated among young people (Milner 2005; Blais et al. 2002; O'Neil 2001), and the possibility that it is causing certain ethnic groups and the more vulnerable members of society to become disenfranchised (Hicks 2006; see also Pal and Choudhry 2007), is beginning to generate renewed interest in electoral reform. Several provinces have adopted fixed election dates and are considering moving toward proportional electoral systems.

Yet this reforming spirit has not embraced compulsory voting, despite its being the only administrative mechanism that could immediately and significantly boost voter turnout in federal and provincial elections. Senator Harb was unable to win meaningful support for his legislation in the Senate. For

Table 2
Voter Turnout in Federal Elections, Canada, 1945-2006

Date of election	Population	Number of electors on lists	Total ballots cast	Voter turnout (%)
June 11, 1945	11,494,627	6,952,445	5,305,193	75.3

Source: Elections Canada (2007).

¹ This election was conducted without a new enumeration; lists compiled for the referendum of 1992 were used (except in Quebec, which had conducted its own enumeration and referendum, so a new federal enumeration was required). Following this election, Canada moved to a permanent register of electors; see Black for an analysis of how the permanent voters list affected electoral participation in Canada (2003).

² Following the 2000 election, Chief Electoral Officer Jean-Pierre Kingsley instructed that this turnout figure be adjusted to accommodate deaths among the electorate and duplications related to household moves. The revised figure was 64.1 percent, which was further removed from the 60 percent threshold that prompted debate over compulsory voting.

Senator Don Oliver, a former member of the Lortie Commission, there was "something inherently anti-democratic about enacting legislation to essentially coerce or force Canadians into exercising their democratic rights."¹¹ Senator Jack Austin called compulsory voting an infringement on personal liberty,¹² while Senator Noël Kinsella suggested that the right to vote set out in section 2(a) of the Canadian Charter of Rights and Freedoms included the right not to vote.¹³ The legislation died on the Senate order paper when Parliament was dissolved in November 2005.

Like the Lortie Commission, Courtney has argued that the very idea of compulsory voting and sanctions may run contrary to basic Canadian values (2004). He suggests that classical liberal ideology has created a natural resistance in the electorate,¹⁴ and among Canadian elites, to the idea of any form of state-enforced voter participation. Given this apparent resistance to compulsory voting, Hicks had earlier suggested that Canada might be uniquely situated to instead follow the Athenian example and compensate lower-income Canadians for some of the costs they incur when voting (2002).¹⁵

In light of current trends, it is clear that the debate over ways to boost turnout will continue in this country for some time. While compulsory voting and voting incentives have received only limited consideration to this point, it is inevitable that attention will turn to such mechanisms, and an informed debate should be encouraged.

The general arguments

Clearly, the most compelling argument for compulsory voting is that it will boost electoral turnout, especially among the weakest in society. As we have seen, the most frequently voiced argument against it is the libertarian one: it infringes on individual freedom and personal liberty — that is, the right some argue is implicit in a free and democratic society not to vote. The central question then becomes: Even if it will increase turnout and reduce possible class and/or ethnic bias, is it democratic to compel people to vote, and can elections conducted under compulsion and threat of sanction be considered free and fair (Lever 2007)? It was a negative answer to this question that led to the abolition of this measure in the Netherlands in 1970.

Supporters of compulsory voting argue that "the benefits of increased legitimacy, representativeness, political equality and minimization of elite power justify the element of compulsion, especially considering the relatively minor restriction of personal freedom that is entailed" (Keaney and Rogers 2006, 30). Furthermore, they point out that when compared with civic obligations that are readily accepted as necessary for the good of society, such as performing jury

duty and paying taxes, compulsory voting would be a relatively minor imposition on personal freedom (Engelen 2007; Hicks 2002). Opponents counter that refusing to participate can be a form of expression, that people need the power to withdraw legitimacy from their governments, and refusing to vote is one of the most peaceful ways to do this. Moreover, compulsory voting does not address the underlying causes of low voter turnout but masks them instead.¹⁶ If citizens are not voting, then it is incumbent on governments and political parties to address those causes.

There is, however, another side to this argument; namely, that where voting is voluntary, political parties expend sizeable resources mobilizing their own supporters rather than winning over undecided voters. In a compulsory voting environment, parties would be forced to engage with the groups least interested in politics and most dissatisfied with the political situation, rather than simply focusing on the party faithful and ensuring they vote on election day (Keaney and Rogers 2006, 29). If socio-economic status is tied to voter turnout, then compulsory voting would force politicians to engage with ethnic, linguistic and other minority communities, an essential undertaking in a bilingual and multicultural society like Canada (Hicks 2006).

Advancing arguments for or against compulsory voting and voting incentives to induce nonvoters to become full participants in the system invariably raises the thorny issue of the quality of participation. In fact, most arguments related to political participation hinge on three theoretical democratic pillars: citizen engagement, political representation and vote choice. Each of these has an informational component. Classic democratic theory as it emerges in the 18th century was predicated on an informed voter who thoughtfully considers the issues and arguments before casting a ballot. This leads to reasoned debate and the election of representatives who reflect the community. Social contract theory posits individual citizens coming together to form a collective will. Individuals are thus forced to subordinate their egoist natures, giving rise to a state that offers equal protection to all of the interests it contains. Even rational choice theory, which is based on a more self-interested citizenry, links voter turnout directly to information and the cost of acquiring it. The question then becomes whether compulsory voting results in better representation in Parliament for the electorate or in a failure to improve representation — since the measure would merely bring uninformed citizens to the polls and thus reduce the likelihood that well-considered choices would be made on political issues. And concern about uninformed voters determining electoral outcomes is what led John Stuart Mill to suggest that votes should be weighted based on the elector's degree of intelligence and ability (though he could think of no effective test of these qualities).

Milner makes the distinction between informed voters who do not vote out of apathy or as a protest and voters who fail to vote because they lack the basic information they need to do so — people whom he classifies as “political dropouts” (2005). Yet proponents of compulsory voting are optimistic that the very act of voting will have beneficial effects on the citizenry. Lijphart suggests that it creates “an incentive to become better informed...a form of adult education” (1997, 10), while Hill claims that voting can be a first step toward combatting social isolation and marginalization (2000).

When considering youth, the socialization dimension frequently emerges as central to the voting equation. Proponents of compulsory voting insist that if voting is a habit and a skill acquired in youth, and perhaps linked to other forms of civic duty, then compulsion is justified. But here, too, the debate invariably returns to divergent views on the quality of the participation.

Information gathering

In his well-known presidential address to the American Political Science Association in which he called for compulsory voting, Lipjhart suggested that such a measure would result in (among many other benefits) a more politically knowledgeable population (1997). Yet others argue that “whether or not this is true is open to conjecture” (Weller and Fleming 2003, 21). Bilodeau and Blais could find no empirical studies to support Lipjhart’s claim (2005). To fill the gap, they attempted to substantiate his claim in three ways, all of which were indirect and yielded inconclusive results. They first looked at people in western European countries where voting is compulsory to determine whether they discuss politics more than others. Then they looked at immigrants to New Zealand from compulsory-voting Australia. Finally, they looked at immigrants to Australia from compulsory-voting countries. In each case, they sought differences in reported levels of political discussion, interest in politics and attitudes toward voting, but they were unable to find evidence of socialization due to compulsory voting.

The same result emerged from a recent analysis of Belgian survey data by Engelen and Hooghe, who used a hypothetical question — “What if voting were not compulsory?” — in an effort to isolate those who vote to avoid sanction (2007). Another recent study, using data from the Polish Election Survey, employed the same method in reverse: it asked nonvoters what they would do if voting were compulsory (Czesnik 2007). Not surprisingly, those who reported voting to avoid sanction were the least interested and knowledgeable. Ballinger looked at the British and Australian evidence and determined that Australians are no better informed about political systems. He concludes that “compulsory turnout in Australia may have masked a system in which political knowledge,

and especially youth engagement with politics, is not necessarily higher than we currently have in the UK" (2007, 9).

While these studies are suggestive, they display two methodological problems that hinder extending inference to the second-order effects of compulsory voting. First is the probability of a major difficulty with cross-national comparability when it comes to survey questions tapping political knowledge. It is very hard to establish that two national scales are measuring the same type and amount of political knowledge. Moreover, even if the scales are measuring exactly the same quantities, we cannot be certain that the same amount of knowledge would be required in each country for effective democratic citizenship. The second problem is that even if we can come up with directly comparable measures of survey knowledge, the analyst will still be confronted with unobserved heterogeneity. It is entirely plausible that the countries that adopt compulsory voting are the countries that have the least engaged citizenries. We cannot thus assume that any observed differences are a function of compulsory voting and not some unobserved variable in the populations.

In the absence of a change in electoral law within a given country, allowing for a before-and-after quasi-experiment, there is no unambiguous empirical basis for determining the second-order effects of compulsory voting. What we need, therefore, is a method that decouples compulsory voting from pre-existing levels of citizen engagement and knowledge. One such method is an experiment that randomly subjects some voters to a treatment resembling compulsory voting while subjecting others to a control condition. We now turn to one such experiment.

The Experiment

The logic of our experimental design is quite simple. We recruited a group of students at a Montreal junior college (a CÉGEP) to participate in a study that consisted of two surveys we described as being about "youth attitudes"; these surveys were administered approximately one month apart — specifically, at either end of a provincial election campaign. All students who completed the surveys were eligible to receive \$25, except for a randomly selected subset, who also had in addition to vote in the provincial election in order to be paid.¹⁷ We were thus left with one group whose members faced a financial disincentive if they chose not to vote, and another whose members faced no such disincentive. By comparing the differences between these two groups related to increased political knowledge, media news consumption and discussion about politics, we were

able to draw strong inferences about the effects of compulsory voting and incentives on voters — especially first-time voters. As a result of our design, those in our treatment condition faced a financial incentive to vote. This may differ theoretically from the prospect of losing money by having to pay a fine, but we believe that it sufficiently approximates compulsion.

Quebec's Directeur général des élections (DGE) is responsible for the administration of elections in the province, including the registration of voters and the administration of polling stations. The cooperation of his office made it possible for us to verify that our subjects voted; such verification had never been done before, and it required no small effort on the part of the DGE. The survey was conducted at Vanier College, a Montreal English-language CEGEP with over 5,000 students from a variety of socio-economic and ethnic backgrounds, the majority of whom are in pre-university programs.

Subject recruitment and survey administration

Recruitment occurred in over 60 Vanier College classes. We specifically targeted students in social science and commerce general education courses — that is, courses with minimal admission requirements.¹⁸ The classes we chose were those most likely to contain students who on election day would be at least 18 years of age, the voting age in Quebec (as it is in the rest of Canada). Interested students were asked to fill out a registration form containing 10 otherwise unrelated questions,¹⁹ one of which was whether the respondent expected to vote in the upcoming Quebec election.

Once the election was formally announced, 205 of the students who had filled out the forms and who were eligible to vote were invited by e-mail or telephone to complete the questionnaire in a classroom at the college on a given date at a set time. The students who had said in their applications that they did not intend to vote or were unlikely to vote constituted the majority of the 205. Half of the 205 were randomly assigned to two treatment rooms and the other half were randomly assigned to two control rooms.²⁰ Disappointingly, only 55 students showed up. All of them were given instructions, a research consent form and a questionnaire. The only difference was that the students in the treatment rooms were told that they would be obliged to vote in order to be paid. Students in the control group rooms were not told that any students were being asked to vote, or that the survey was associated in any way with the election; they were merely informed that they would be given a second questionnaire in approximately one month's time.

To expand our sample, we then e-mailed or telephoned those who had not turned up at the first invitation and 255 of the remaining students who had filled out the forms (and stated that they would likely vote). We offered them the

option of completing the attached survey by e-mail or completing it in a secretary's office on the college campus at their convenience (within a five-day window). Once again, assignment to treatment was randomly determined (for details concerning the randomization process, see appendix 1). At the end of the first round, we had 82 participants in the control condition and 101 in the treatment condition. Overall, 52 percent of respondents completed the first survey on-line, while the remainder filled out a paper version.

The second round of the survey was administered during the five days prior to the election. All participants in the first round of the survey were e-mailed the second survey and asked to complete it on-line or on paper (at the same secretary's office, within a five-day window). The e-mail text differed for those in the treatment and control groups only with regard to the obligation to vote. The deadline for completing the second questionnaire coincided with the close of polls on election day (March 26, 2007). In all, 143 participants completed the questionnaire (all but 6 did so electronically).

All students had to complete and sign, in person, a research consent form (the electronic version was rejected by the DGE) granting the college permission to provide the DGE with their names and addresses so that the DGE could verify that they had voted. Hence, excluding those who failed to fill out the consent form, as well as treatment group members whose voting we were unable confirm,²¹ the final participation rate was 55 young people in the control group and 66 in the treatment group.²²

The questionnaires

Students who chose to participate in the experiment (either on paper or on-line) were all given the same surveys (the second survey is found in appendix 2). The first survey contained a number of questions about their media usage, their engagement in political discussion, and their attitudes toward politics and political involvement, followed by a set of political knowledge questions. As the overall purpose of the experiment was to determine whether those who have a financial incentive to vote (or a financial disincentive not to vote) pay more attention to politics, we carefully selected a variety of knowledge questions. These ranged from questions about the positions of the different parties on various issues in the campaign (such as whether university tuition should be raised), to questions about political facts (such as which party was in power when the election was called), to questions related to election knowledge (such as what date had been set for the election, and who is eligible to vote). In sum, we included a range of questions designed to identify those with a rudimentary knowledge of politics generally and current Quebec politics specifically.

Table 3
The Experimental Effect of Compulsory Voting

	Control	Treatment	All subjects	<i>p</i> , treatment > control
a) Effects of compulsory voting on political knowledge¹				
Nonvoting	0.37 (0.25) <i>n</i> = 11	0.32 (0.22) <i>n</i> = 12	0.34 (0.23) <i>n</i> = 23	0.72
Voting	0.41 (0.20) <i>n</i> = 42	0.45 (0.24) <i>n</i> = 54	0.43 (0.22) <i>n</i> = 96	0.16
All subjects	0.40 (0.21) <i>n</i> = 53	0.43 (0.24) <i>n</i> = 66		0.25
<i>p</i> , voting > nonvoting	0.32	0.04	0.04	
b) Effects of compulsory voting on news consumption²				
Nonvoting	2.40 (1.08) <i>n</i> = 12	1.29 (1.02) <i>n</i> = 12	1.84 (1.18) <i>n</i> = 24	0.99
Voting	1.94 (1.16) <i>n</i> = 39	2.69 (1.41) <i>n</i> = 52	2.37 (1.36) <i>n</i> = 91	0.00
All subjects	2.05 (1.15) <i>n</i> = 51	2.43 (1.45) <i>n</i> = 64		0.07
<i>p</i> , voting > nonvoting	0.87	0	0.04	
c) Effects of compulsory voting on political discussion³				
Nonvoting	0.51 (0.14) <i>n</i> = 12	0.48 (0.17) <i>n</i> = 12	0.52 (0.15) <i>n</i> = 24	0.67
Voting	0.52 (0.16) <i>n</i> = 41	0.52 (0.17) <i>n</i> = 54	0.52 (0.17) <i>n</i> = 95	0.41
All subjects	0.52 (0.16) <i>n</i> = 53	0.52 (0.17) <i>n</i> = 66		0.48
<i>p</i> , voting > nonvoting	0.45	0.22	0.26	

¹ Cells indicate average knowledge score (standard deviation) and the number of subjects in the cell. The final column reports *p*-scores of an unpaired *t*-test of mean differences between treatment and control conditions. The final row reports *p*-scores of a test of mean differences between those who indicated an intention to vote and those who did not.

² Cells indicate average second-round news consumption score out of 7 days (standard deviation) and the number of subjects in the cell. The final column reports *p*-scores of a test of mean differences between treatment and control conditions. The final row reports *p*-scores of an unpaired *t*-test of mean differences between those who indicated an intention to vote and those who did not.

³ Cells indicate average second-round political discussion score (standard deviation) and the number of subjects in the cell. The questions asked about frequency of political discussion and the response are scored: 0 = never; 0.33 = rarely; 0.66 = sometimes; and 1 = very often. The final column reports *p*-scores of a test of mean differences between the treatment and control conditions. The final row reports *p*-scores of an unpaired *t*-test of mean differences between those who indicated an intention to vote and those who did not.

We did much the same with the second questionnaire; however, we added several political knowledge questions, bringing the total to 23. Of the questions, nine were repeated verbatim from the previous questionnaire, 2 were altered versions of previous questions, and 12 were new (almost all of them closely linked to developments in the campaign). We are confident that the full battery of questions is an appropriate instrument for uncovering any significant knowledge differences between our two groups relevant to electoral participation in this time and place.

Results

The first-order effect of compulsory voting — increased turnout — is quite clear. However, the second-order effects of greater knowledge and engagement are not. We argue that the possible second-order effects of compulsory voting on citizen engagement can be operationalized in the form of three hypotheses:

1. Those who face a financial disincentive to abstain from voting should learn more about politics than those who do not face a similar disincentive.
2. Those who face a financial disincentive to abstain from voting should discuss politics more frequently — especially those for whom this makes the difference between voting and abstaining — than those who do not face a similar disincentive.
3. Those who face a financial disincentive to abstain from voting should follow the news more frequently — especially those for whom this makes the difference between voting and abstaining — than those who do not face a similar disincentive.

We find little support for these hypotheses in our data. As we found no significant differences between treatment and control conditions in our first-round scores, we limit the analysis to second-round scores. Table 3a) presents comparisons of knowledge scores on the second survey between those in the control and treatment conditions and those who voted in the election and those who did not. Each cell presents a mean for the group in question, its standard deviation and the number of individuals in that group. The final column provides the results of a *t*-test of mean differences between those in the control and treatment conditions. The final row likewise provides the results of a *t*-test of mean differences between those who indicated an intention to vote and those who did not. The lower the *p*-value, the more confident we can be that the difference between our groups does not occur by chance (0.05 is the critical point at which we are sure that the difference is different from 0, 19 times out of 20). As we can see, the overall difference in the second round between groups under treatment and control conditions is not significant. Moreover, when we split the groups into those

Table 4
The Effect of Treatment on Knowledge, News Consumption and Discussion of Politics for Voters and Nonvoters¹

Country	Knowledge	<i>t</i>	News	<i>t</i>	Discussion	<i>t</i>
Treatment	-0.06	-0.54	-0.70	-1.03	-0.07	-1.03
Expected to vote	0.11	1.47	-0.03	-0.07	0.12**	2.61

¹ The columns report coefficients and *t*-values from three separate regressions. We limit our analysis to those in the control condition who completed both surveys and those in the treatment condition who completed both surveys and voted. *T*-scores indicate the ratio of the estimated coefficient to its standard error; a higher *t*-score indicates a higher probability that the observed effect is not due to chance.

* $p < 0.10$. ** $p < 0.05$.

who voted and those who did not,²³ we do not uncover significant treatment effects. Giving (young) voters a financial disincentive to abstain from voting did not increase the amount they learned about politics.²⁴ Rather, our findings suggest that those in both control and treatment were able to answer about 4 out of 10 questions correctly. The only significant difference is between those subjects who intended to vote at the outset of the experiment and those who did not, with the former correctly answering about 1 more question in 10 than the latter.

We next consider the possibility that the treatment students did try to learn more about politics but were unable to do so. We find no evidence that they increased their general engagement with politics through discussion, which could have signalled a greater effort to learn. Rather, all subjects, on average, reported discussing politics somewhere between rarely and sometimes.

Despite the absence of findings on political discussion, when it comes to news consumption, there is an indication that subjects in the treatment condition consumed more news by the end of the campaign than those in the control condition. In table 3b), we see that news consumption seems to increase with treatment — certainly in the voting group ($p < 0.00$), and probably overall as well ($p \leq 0.07$). It is hard to know how much significance to attribute to this (those in the control condition on average reported consuming all forms of news 2.05 days out of 7, while those in the treatment condition reported consuming all forms of news 2.43 days out of 7).²⁵ This difficulty occurs because we do not know at which point greater media consumption begins to yield knowledge

benefits, or at which point it signals a more engaged electorate. In itself, it is consonant with the claims of compulsory-voting advocates, but it creates a new puzzle in that it does not manifest itself in any measurable increase in knowledge.

Aside from our news-consumption finding, we did not discover support for the hypothesis that when individuals are financially compelled to vote they become more politically attentive and knowledgeable citizens. But it is possible that this effect is isolated in the group where we would most expect to find it — those who would normally not vote. If compulsory voting does increase attentiveness and knowledge, then we might find the effect among those who did not intend to vote at the outset of the study but were assigned to the treatment and then voted. We test this proposition in table 4. We limit our analysis to those in the control condition who completed both surveys and those in the treatment condition who completed both surveys and voted.²⁶ Our approach is to use a conventional ordinary least squares (OLS) analysis, regressing second-round scores for knowledge, discussion and news consumption on a dummy variable indicating treatment, another indicating whether the subject initially reported that he or she expected to vote (*expvoter*), and an interaction between these two variables. We also include dummy variables indicating whether a subject is francophone or allophone (with anglophones acting as the comparison group), and whether the subject is female. The following regression equation for political knowledge captures the effect of treatment on initial nonvoters:

$$Y(\text{knowledge}) = a + b1 * \text{treatment} + b2 * \text{expvoter} + b3 * \text{expvoter} * \text{treatment} + b4 * \text{allo} + b5 * \text{French} + b6 * \text{female} + e$$

As we are interested in the effect of treatment (*treatment* = 1) on nonvoters (*voter* = 0), we are left with the following equation:

$$Y(\text{knowledge}) = a + b1 * \text{treatment} + b4 * \text{allo} + b5 * \text{French} + b6 * \text{female} + e$$

Accordingly, the specific effect of compulsory voting on knowledge acquisition (or levels of discussion, or news consumption) among nonvoters is captured by the coefficient on treatment.²⁷ This effect is presented in the first row of results in table 4.

We should note that we do not include several other variables that we know are related to political knowledge and engagement (see Fournier 2002). Because we are using a randomly assigned experiment, we can assume that these factors are equally present in our control and treatment conditions. Including them should not theoretically change the estimated effects of the compulsory voting treatment.²⁸ Accordingly, we exclude them and stay with a simpler model.

As table 4 demonstrates, we find a treatment effect on news consumption among those who intended to vote in the first place. Our results suggest that those in the treatment condition who intended to vote consumed all types of news approximately 0.7 days per week more than those who did not intend to vote. However, we can find no effect of the treatment among those who would otherwise be nonvoters — hence we are unable to reject the null hypothesis that compulsory voting does not increase the news consumption of nonvoters. Moreover, on both our knowledge variable and our discussion variable, we cannot find a significant effect of treatment either among those who intended to vote or those who did not. In sum, the data does not give us any good basis for rejecting the null hypothesis: to the extent that our experiment reproduces a compulsory voting context, we find that compulsory voting does not boost political knowledge, discussion about politics and news consumption among young potential voters.

We should note that the number of subjects who filled out a form stating that they did not expect to vote or were uncertain whether they would vote was well worn down by attrition by the end of the second round; only 22 of our 121 subjects fit this category. While this is a small number of subjects, we do also note that the signs of the compulsory voting effects are not even in the expected direction. We do not believe this nonfinding to be a problem of inadequate statistical power.

Discussion and Conclusion

Before turning to compulsory voting, we must look at two findings from this study that inform other questions currently being examined in political science. First, there has been some reticence about posing political knowledge questions, as they may embarrass the uninformed respondent. At least as far as young people are concerned, this appears to be a non-issue. The matter arose when we found ourselves forced to use on-line surveys, and our initial concern was that some students responding on-line might seek answers to the knowledge questions on the Internet so as not to appear uninformed (and thus skew our findings). This concern proved unwarranted, as we could find no discernible difference in political knowledge scores between the two groups (those who used the Internet and those who completed the questionnaire in person under supervision). The fact that these students didn't make the extra effort strongly suggests that they did not feel embarrassed by their lack of political knowledge or attentiveness to politics in the media.

Second, the low level of political knowledge and lack of interest in electoral politics among young people in Canada was more than confirmed in this study. In table 3, we can see that at the end of the campaign the average student paid attention to news in the media just over two days a week, resulting in an average political knowledge score of just over 40 percent. When we break down the score question by question, we find that more than half the students were able to identify the party leaders, the party in power, the most federalist party and the date of the election, but only a quarter, on average, got the issue-related questions right — the equivalent of chance.

Turning now to the issue of compulsory voting, it is important to keep in mind that we did not exactly replicate a compulsory voting environment. Economists and psychologists have shown that people are more willing to risk losing money promised to them than money already in their pockets (Kahneman and Tversky 1979). Nevertheless, as recorded in table 1, many compulsory voting systems have weak, poorly enforced sanctions, and the loss of an expected \$25, though a relatively small amount, is not a negligible sanction for 18- and 19-year-olds. Hence, without claiming that we have recreated the conditions of compulsory voting, we can legitimately state that under the conditions of the experiment there should be some measurable indication of an increase in attentiveness due to some of the same processes as would operate under compulsory voting. Additionally, the experiment does closely replicate the effects of voter incentives, which are sometimes offered as a less-intrusive alternative to sanctions.

Nevertheless, we do not wish to overstate our results, principally because they occur in the context of an experiment with a survey instrument conducted over a nonrandom population. The generalizability or external validity of our inferences may be limited (Shadish, Cook and Campbell 2002), but we have not found anything in the literature to suggest that the effects will be nil among youth but strong among others. The contrary is more likely to be the case, since the literature shows that the turnout effects of compulsory voting are greatest in electoral contests where turnout is lowest and among groups that would otherwise be the most disengaged. If second-order effects exist, we would also expect them to be strongest in this category of voters. Young people generally, and those in Canada particularly, certainly belong in this category.

In stating this, we are not making a case against compulsory voting. There may be good reasons to be concerned about turnout — especially if it reaches a point where abstaining is as legitimate as voting. Furthermore, compulsory voting may have a significant impact on how parties create and target their platforms, how they organize their campaigns, and what communities they are attentive to in terms of resources and policy commitments. As Lijphart

has rightly argued, compulsory voting "makes voting participation as equal as possible" (1997, 11).²⁹

Nevertheless, our findings do place the ball in the court of the advocates of compulsory voting — at least, those who suggest that individuals will seek out more information so as to make correct decisions when compelled to vote. Their contention, however plausible, needs to rest on empirical evidence. We were unable to confirm it in our experiment. Our results suggest that though it is a sufficient motivator for getting an uninformed voter to the polls, the desire to avoid relinquishing money is not a sufficient motivator for getting that voter to learn more about politics. This is hardly the end of the story. But advocates of compulsory voting will need to provide a more compelling, empirically based micro-story about how it makes better — or at least better-informed — citizens.

There is the possibility that socialization to active citizenry takes time, though this has never been suggested by those who call for compulsory voting. In fact, according to its supporters, it is the immediacy of the benefits deriving from the act of voting that make compulsion desirable. If information collection is something that occurs over time, then this fact could be used to buttress arguments both for and against compulsory voting, so there are merits to pursuing this question in future research.

We should make one final point about young people's readiness to take part in the experiment more generally, which has implications for compulsory voting and other measures affecting political participation. After distributing well over 1,000 recruiting forms we had expected to receive an excess of applications, from which we would choose 200 respondents who did not expect to vote. Yet of those eligible to vote who filled out a form, only 20 percent stated that they did not expect to vote or were uncertain whether they would vote. In all likelihood, the nonvoters among those enrolled in the classes from which we recruited were more likely to be absent from school or to be unwilling to indicate their interest in participating. This has direct implications for, to give one example, our reliance on permanent registers of electors that are based on voluntary participation.

We were even unable to get most of the people who completed the form and expressed a willingness to participate to come to a locale within the school they attended regularly. And, despite the fact that we made administrative changes (that is, let subjects complete the forms on-line) and undertook active mobilization exercises (such as repeated e-mails supplemented by telephone calls), we still had a large attrition rate, particularly among the nonvoters. This is particularly significant since, historically, the mechanisms used to increase turnout for Canadian elections — the only ones supported by the Royal

Commission on Electoral Reform and Elections Canada to date — have been administrative changes and mobilization efforts. Clearly, such mechanisms will not be sufficient to activate the next generation of recalcitrant voters (young people for whom instantaneous communication and technological convenience will always be present). This may be good news for supporters of compulsory voting, as it implies that past initiatives may be increasingly ineffective; though it is bad news for the health of Canada's representative democracy. It would also seem to suggest that voter incentives like those Hicks suggests will fail to overcome lack of interest in participating in the groups he identifies as most at risk (2002, 2006).

When voter turnout in Canada was at approximately 75 percent, Pammett's research for the Royal Commission on Electoral Reform suggested that "there is a small hard core of perennial non-voters, numbering perhaps five per cent of the population at most" (1991, 34), and that these persons were distinct from the approximately 20 percent who chose not to participate from election to election. British politician Geoff Hoon, a prominent advocate of compulsory voting, refers to the former group as "serial non-voters" (Ballinger 2007, 11). Milner has identified a similar group among the young, which he calls the "political dropouts," and he has sounded the alarm that their numbers may be increasing (2005). This group does, in fact, appear to be growing; and it seems likely to include a higher proportion of males than females.

Overall, then, the future does not look bright for voter participation in Canada as this next group of youths enters the electoral pool. If, as seems to be the case, disengagement and lack of interest are becoming the rule and not the exception, then there is good reason to expect that turnout will not return to previous levels — and it may decline even further. Compulsory voting may be one solution, but in this paper we have raised a number of questions surrounding it. Much more work needs to be done on how information related to voting is obtained and processed by members of society who normally do not vote. Specifically, research is needed on whether information collection alters over time with repeated voting. Additionally, many of the other dimensions of this debate should be more deeply examined, such as how parties respond to greater numbers of voters when mobilization is no longer so central to their electoral strategies. The debate over voter engagement and participation is just beginning in Canada, and it can only benefit from more empirical research. We have merely begun to scratch the surface.

Appendix 1: Randomization

The randomization of participants proceeded in three steps. First, we identified all subjects (119) who indicated on the initial recruitment form that they did not expect to vote or were unsure whether they would vote. Using a random number generator, we assigned each of these subjects a number and then ranked them according to this number. The top half were assigned to the treatment condition and the bottom half to the control condition. Second, we assigned a random number to all potential participants who indicated that they were likely to vote. We selected the top 86 of these participants. The top half of the selected group was assigned to the treatment condition and the bottom half to the control condition. Third, to expand our sample using an on-line survey, we invited the remaining 255 eligible participants to take part in the study. We assigned subjects to treatment and control prior to contact using the method of random number assignment and then ranking them as we have described. However, in this instance, 70 percent were assigned to treatment (where attrition could be expected to be high) and the remaining 30 percent to control.

We have checked our randomization procedure across several key variables, and, for the most part, we found no significant differences between conditions in the first round, suggesting that our randomization worked. In each test of balance, χ^2 indicates the score of a chi-square test of the relationship between treatment and another variable. The p -score indicates the probability that the relationship observed is due to chance. Lower χ^2 and higher p -scores indicate that the relationship is due to chance and that treatment is thus uncorrelated with that variable. Our treatment was balanced according to gender ($\chi^2 = 0.82$, $p = 0.37$), with female participants making up 73 percent of the treatment group and 67 percent of the control group. (Women students are considerably overrepresented in the pre-university social science program; and, as noted, attrition was lower among the female students.) Internet usage was also insignificantly related to treatment assignment ($\chi^2 = 5.84$, $p = 0.44$). Most importantly, there was no difference in the average knowledge scores in the first wave of the survey between the two groups ($\chi^2 = 7.06$, $p = 0.63$). The same is true for political discussion and media news consumption. Both the control and the treatment groups showed remarkably low levels of knowledge about Quebec politics, with more than half of the respondents in each group getting 3 or fewer questions out of 11 correct. There is also no difference in knowledge when we control for the likelihood of voting. There is, however, a language difference: those who speak French at home as their first language know significantly more about politics than those who do not.³⁰ We should note, however, that language is unrelated to randomization.

We did encounter one possible problem with our randomization: considering all the students whom we invited to participate, those assigned to the control group chose to participate in larger numbers (66 percent) than those in the treatment group (54 percent). This is a significant difference ($\chi^2 = 6.50, p = 0.03$), and it raises the possibility of a difference between those who were assigned to the treatment condition and then chose to participate, and those in the control condition who chose to participate. Because the treatment condition requires more effort than the control condition (that is, voting), those who chose to participate under the treatment regime may be more motivated in general. Their general level of motivation may also make them more likely to seek out political information. If these groups are unbalanced, any growth found in political knowledge in the treatment group could be attributed to its members' general level of motivation (which could differ from that of the control group members) rather than to the incentive to learn created by mandatory voting. Nevertheless, other factors led us to lay aside this concern.

In our first round of invitations — we asked potential participants to gather in a room but did not tell them the details of the experiment — we had 31 participants in the control condition and 22 in the treatment condition. No participant who showed up declined to fill out the survey. Despite the fact that participants were randomly assigned, about 50 percent more participants in the control condition showed up than participants in the treatment condition. But, as this was due to chance, there is no unobserved effect among our first set of participants. When we parse out these participants from our larger pool, the possible motivation effect disappears, and the difference between the two groups is no longer significant in terms of likelihood of participating in the experiment. Taken together, all of these tests suggest that our randomization procedure did not lead to any unobserved differences between the groups, which could also be expected to affect knowledge acquisition. As a result, we are confident that any experimental (non-)effects will be the result of our treatment — that is, compulsory voting.³¹

Appendix 2: The Second Questionnaire

Université de Montréal/Vanier College Youth Attitudes Survey

- 1) Language you speak most often at home (please choose one by marking an X next to your answer)

French

English

Other

- 2) Do you use the Internet from home, school or work and, if yes, thinking back over the last 7 days, how many days did you use the Internet? (please mark an X next to your answer)

0 1 2 3 4 5 6 7

Never use

Don't know

- 3) Some people seem to follow what's going on in government and public affairs most of the time. Others aren't that interested. Do you follow what's going on in government and public affairs most of the time, some of the time, rarely or never? (please mark an X next to your answer)

Most of the time

Some of the time

Rarely

Never

- 4) Some people seem to follow what's going on in the Quebec election campaign most of the time. Others aren't that interested. Have you been following what's going on in the Quebec election campaign most of the time, some of the time, rarely or never? (please mark an X next to your answer)

Most of the time

Some of the time

Rarely

Never

- 5) How often do you talk about current events or things you have heard about in the news with your FAMILY — very often, sometimes, rarely or never? (please mark an X next to your answer)

Very often

Sometimes

Rarely

Never

- 6) How often do you talk about current events or things you have heard about in the news with your FRIENDS — very often, sometimes, rarely or never? (please mark an X next to your answer)

Very often

Sometimes

Rarely

Never

Here are some ways that people get news and information. Over the last 7 days, please estimate on how many days you have done each of the following. (please circle the number of days)

- 7) Read a newspaper

0 1 2 3 4 5 6 7

- 8) Watch the news on TV

0 1 2 3 4 5 6 7

- 9) Listen to the news on the radio

0 1 2 3 4 5 6 7

- 10) Read news on the Internet

0 1 2 3 4 5 6 7

Here is a quick list of things that some people have done to express their views. For each one, please indicate whether you have ever done it or not. (please mark an X next to your answer)

- 11) Contacted a newspaper or magazine to express your opinion on an issue

No Yes

- 12) Called in to a radio or television talk show to express your opinion on a political issue, even if you did not get on the air

No Yes

- 13) Taken part in a protest, march or demonstration

No Yes

- 14) Signed an e-mail or a written petition about a social or political issue

No Yes

- 15) How much difference does it make which political party is in control of the government — a lot, some, a little, or no real difference? (please mark an X next to your answer)

A lot Some difference A little difference No real difference

Here are a few questions about things that have been in the news. Not everyone will know the answers, but we'd like to know how much youth know about politics. It's OK to say you don't know, but if you have an idea, please indicate it.

- 16) The leader of the Quebec Liberal Party is (please write in the answer)
- _____
- _____
- _____
- 17) The leader of the Parti québécois is (please write in the answer)
- _____
- _____
- _____
- 18) The leader of the ADQ (Action démocratique) is (please write in the answer)
- _____
- _____
- _____
- 19) Of the three main parties, which is the most federalist? (please mark an X next to your answer)
- | | |
|---------------------------|-------------------------|
| Parti québécois | Parti libéral du Québec |
| ADQ (Action démocratique) | Don't know |
- 20) Which party is furthest to the right (i.e., more conservative)? (please mark an X next to your answer)
- | | |
|---------------------------|-------------------------|
| Parti québécois | Parti libéral du Québec |
| ADQ (Action démocratique) | Don't know |
- 21) Which of the following best describes who is entitled to vote in Quebec elections? (please mark an X next to your answer)
- | | |
|----------------------------|-----------------------------------|
| Resident of Quebec | Taxpayer in Quebec |
| Landed immigrant in Quebec | Canadian citizen living in Quebec |
| Don't know | |
- 22) Which party was in power in Quebec when the Quebec election was called?
- | | |
|--------------------|---------------------------|
| Parti québécois | Parti libéral du Québec |
| Parti conservateur | ADQ (Action démocratique) |
| Don't know | |

- 23) When the election was called, which party had the second-largest number of seats in the Assemblée nationale? (please mark an X next to your answer)
- | | |
|--------------------|---------------------------|
| Parti québécois | Parti libéral du Québec |
| Parti conservateur | ADQ (Action démocratique) |
| Don't know | |
- 24) Which party leader has raised questions about Quebec's approach of "reasonable accommodation" of minorities? (please mark an X next to your answer)
- | | |
|-----------------|---------------|
| André Boisclair | Mario Dumont |
| Gilles Duceppe | Stéphane Dion |
| Don't know | |
- 25) The date of the Quebec election is the (please mark an X next to your answer)
- | | | |
|----------|------------|----------|
| 25 March | 26 March | 27 April |
| 28 April | Don't know | |
- 26) Which party wants to maintain the freeze on university tuition fees? (please mark an X next to your answer)
- | | |
|---------------------------|-------------------------|
| Parti québécois | Parti libéral du Québec |
| ADQ (Action démocratique) | Don't know |
- 27) Which party leader advocates paying mothers who stay home with the children? (please mark an X next to your answer)
- | | |
|-----------------|--------------|
| André Boisclair | Mario Dumont |
| Françoise David | Jean Charest |
| Don't know | |
- 28) The Charest government has proposed selling off part of a provincial park. In which region have they proposed this? (please mark an X next to your answer)
- | | |
|----------------|------------|
| Mont Tremblant | Orford |
| St. Maurice | Charlevoix |
- 29) Which party leader is taking credit for Quebec having made substantial progress on eliminating the fiscal imbalance with Ottawa? (please mark an X next to your answer)
- | | |
|-----------------|--------------|
| André Boisclair | Mario Dumont |
| Françoise David | Jean Charest |
| Don't know | |

- 30) Do you happen to know the name of your electoral district for the Quebec election? (please mark an X next to your answer)

Yes No

If yes, please write the name of the district:

- 31) Do you happen to know the name of a candidate in your electoral district for the Quebec election? (please mark an X next to your answer)

Yes No

If yes, please write in his or her name:

- 32) Is your name is on the voters list for the Quebec election? (please mark an X next to your answer)

Yes No Don't know

- 33) Did you make any effort to make sure your name is on the list? (please mark an X next to your answer)

Yes No

- 34) During the campaign, an important moment came with decisions announced by Jim Flaherty on March 19th. What is his position? (please mark an X next to your answer)

Federal Finance Minister

Quebec Finance Minister

Premier of Ontario

Premier of Alberta

- 35) How many party leaders participated in the March 13th debate? (please mark an X next to your answer)

One Two Three Four Five Don't know

- 36) Which party leader appeared confused at one point about whether Quebec was divisible or indivisible? (please mark an X next to your answer)

André Boisclair

Mario Dumont

Françoise David

Jean Charest

Don't know

- 37) Which party leader was criticized at one point for using the term "slanted eyes"? (please mark an X next to your answer)

André Boisclair

Mario Dumont

Françoise David

Jean Charest

Don't know

- 38) The polls show how many parties have the support of at least one-quarter of the voters? (please mark an X next to your answer)

Notes

- 1 This study was financed by grants from the Secrétariat à la réforme des institutions démocratiques, the Ministère du Conseil exécutif, the Government of Quebec and the Institute for Research on Public Policy. We would like to thank, in particular, the office of Quebec's Directeur général des élections, without whose cooperation and many hours of effort the project could not have been carried out. We also wish to thank the Canada Research Chair in Electoral Studies at the Université de Montréal and various members of the faculty and staff of Vanier College and for their support and cooperation. We are grateful to the Vanier College administration for making this project possible; in particular, we thank Nora Boyadjin for her competent handling of the written questionnaires, consent forms and money distribution. Peter Loewen thanks the Social Sciences and Humanities Research Council of Canada for funding in the form of a Canada Graduate Scholarship doctoral grant.
- 2 A recent study conducted in Britain, where voter turnout in the last two national elections was the lowest since 1918, found that young people were only half as likely to vote as seniors, and that participation among the first low-turnout generation fell from 70 percent in 1992, when they were in their twenties, to less than 40 percent now that they are in their thirties (Kearney and Rogers 2006).
- 3 Despite these accommodations, getting oneself on the list is now harder due to the establishment of a permanent voters list and the requirement that voters be on the list prior to election day. Such hurdles also inflate participation figures, since these are calculated by comparing the number who voted with the number on the permanent voters list.
- 4 Plato is quoted from "Gorgias." Yet, regardless of this measure, voter participation in ancient Athens did not exceed 25 percent. As Mavrogordatos observes, a "significant number of citizens were simply not interested in attending Assembly meetings" (2003, 8).
- 5 We have no data on how many (if any) of these situations have arisen; imprisonment would be for failure to pay a fine or contempt of court, not for failure to vote per se.
- 6 *Hansard House of Commons Debates*, vol. CXLII, 4th sess., 13th Parliament, 1920.
- 7 This seems to have been the main motivation behind the introduction of compulsory voting in Greece (Malkopoulou 2007).
- 8 The other three criteria were having interests at stake, conforming to the norms of responsible citizenship and being impartial. Impartiality has resulted in election officers and representatives of the other branches of government being prevented from voting (such as judges and the Governor General), and the other criteria have variously prevented men without property, Aboriginal persons, women, children, the mentally ill and prisoners from voting.
- 9 Kingsley was quoted in the *National Post* (December 19, 2000); Steckle and Stoffer were quoted in the *Montreal Gazette* (December 20, 2000); and White was quoted in the *Edmonton Journal* (December 19, 2000).
- 10 Coincidentally, it was in the Australian Senate that compulsory voter legislation was initiated at the federal level through a Senator's private member's bill introduced by (Nationalist) Senator Herbert Payne in 1924, though it had already been in place in the Australian state of Queensland as of 1915 (Bennett 2005; Hicks 2002).
- 11 *Debates of the Senate (Hansard)*, vol. 142, 1st sess., 38th Parliament, 1995, 1425.
- 12 *Ibid.*, 1288.
- 13 *Ibid.*, 674.
- 14 According to an IRPP study of 2000, 73 percent of Canadians are opposed to the

- idea of compulsory voting, though public opinion in Australia showed similar opposition prior to the adoption of that measure; since its adoption, Australians have remained supportive of compulsory voting — between 56 and 73 percent are in favour (Hicks 2002). Because public opposition was anticipated, this change was made through a Senator's private member's bill. While the Nationalist-Country government of the time saw a need for the legislation, it was happy not to have direct responsibility; it ensured that the legislation passed quickly, "like a thief in the night," so that it was in place for the 1925 election. It resulted in an increase of 32 percentage points over the previous election's turnout and gained public approval (Bennett 2005, 4).
- 15 Canada was one of the first countries to offer tax credits for political party donations on the grounds that it would encourage citizens to get involved in the electoral process. Canada also moved early to legislate time off work with pay to make voting easier for working Canadians (the legislation has been regularly readjusted, usually with the goal of making it fairer for lower-income Canadians to participate).
 - 16 In fact, the reason some governments find compulsory voting compelling is that low voter turnout in a representative democracy undermines a government's legitimacy by weakening its mandate to enact its party's platform.
 - 17 The DGE stipulated that all the participants had to be paid, because otherwise it would be tantamount to paying people to vote.
 - 18 Access was facilitated by the fact that the first author is a former professor in this faculty.
 - 19 This included questions such as "Do you play sports on campus?" "Do you own a cell phone?" and "Do you plan to go on to university?"
 - 20 Vanier College has two campuses located at close proximity. To ensure maximum ease of participation, we gave students a choice of room on either campus and arranged for the appointment time to coincide with the weekly universal break, when no classes are supposed to be scheduled.
 - 21 The attrition rate between the first and second surveys was slightly higher among those in the treatment condition than those in the control condition (32.9 percent and 34.7 percent, respectively). We excluded participants whom the DGE could not find on a voters list.
 - 22 While a subject group of 121 is certainly smaller than those used in most conventional randomly sampled surveys, it is at the high end of sample sizes used in many psychology experiments. Moreover, it is large enough for us to run both difference of mean tests and regression with an expectation of adequate statistical power.
 - 23 Of the treatment group, we know that 52 voted and 3 did not. We also assume that 10 did not vote, since they failed to fill out the paper consent forms when told that they would not be paid without having done so — though it is possible that some of them did vote. In the case of 8 participants, it was not possible, for technical reasons, to ascertain whether or not they had voted. We excluded them from the analysis altogether.
 - 24 We have also tested the hypotheses using the differences in knowledge, news consumption and discussion scores between the first and second rounds. Our results do not change substantively.
 - 25 We asked subjects how many days a week they consumed news across four different media: television, the Internet, newspapers and radio.
 - 26 This regression does not include those in the treatment group whom we have identified as nonvoters; but, it does

- include nonvoters in the control group. The reason for the exclusion is that we wanted to isolate effects among those for whom the experiment worked (that is, those who voted) and then compare them with what our "electorate" would look like without compulsory voting (that is, an electorate that included voters and nonvoters).
- 27 The treatment effect for those who intended to vote and did vote is captured by the addition of the *treatment* coefficient and the *treatment * expvoter* interaction coefficient. Finally, the effect of expecting to vote in the first place is captured by "expected to vote."
- 28 If, however, we were undertaking a conventional observational study, we could not assume that these attributes are balanced between control and treatment, and we would have to control for them.
- 29 See also Gallego Dobon and Rico (2007) and Ackaert, Dumont and de Winter (2007). However, Selb and Lachat argue that the votes of poorer, less-educated citizens do not guarantee electoral outcomes in their own interest, since their votes tend to be uninformed and inconsistent (2007).
- 30 We should not be surprised at this, given that more than half the questions were specifically about Quebec politics, which francophones are more likely to follow. It is also possible that there is a certain self-selection among young francophones who choose to go to English-language junior colleges.
- 31 Even with the attrition in our second round, our groups remained balanced by gender ($\chi^2 = 2.72$, $p = 0.10$), language ($\chi^2 = 0.46$, $p = 0.79$) and Internet usage ($\chi^2 = 9.40$, $p = 0.15$).
